

Early Journal Content on JSTOR, Free to Anyone in the World

This article is one of nearly 500,000 scholarly works digitized and made freely available to everyone in the world by JSTOR.

Known as the Early Journal Content, this set of works include research articles, news, letters, and other writings published in more than 200 of the oldest leading academic journals. The works date from the mid-seventeenth to the early twentieth centuries.

We encourage people to read and share the Early Journal Content openly and to tell others that this resource exists. People may post this content online or redistribute in any way for non-commercial purposes.

Read more about Early Journal Content at <http://about.jstor.org/participate-jstor/individuals/early-journal-content>.

JSTOR is a digital library of academic journals, books, and primary source objects. JSTOR helps people discover, use, and build upon a wide range of content through a powerful research and teaching platform, and preserves this content for future generations. JSTOR is part of ITHAKA, a not-for-profit organization that also includes Ithaka S+R and Portico. For more information about JSTOR, please contact support@jstor.org.

PREVALENCE OF DISEASE.

No health department, State or local, can effectively prevent or control disease without knowledge of when, where, and under what conditions cases are occurring.

California—Squirrels Collected and Examined.

During the week ended June 7, 1913, there were examined for plague infection 1,047 squirrels from Contra Costa County, 178 from San Joaquin County, 81 from Alameda County, and 17 from San Benito County.

Plague-Infected Squirrels Found.

From May 15 to June 5, 1913, there were found in Contra Costa County 20 plague-infected ground squirrels collected from 11 localities.

Campaign Against Infected Squirrels.

Hunting operations during 1912 and 1913 have been conducted in such manner that the operations for the two years are as nearly parallel as it is possible to make them; that is to say, that hunting operations are conducted over the same lands for practically the same periods of time and in the same general manner. When a plague squirrel is found on a given piece of land, the hunter is instructed at once to hunt intensively upon that land for the purpose of determining the percentage of infection, and also to hunt upon

adjoining land for the purpose of determining whether plague has extended from that property to the adjoining property; also to determine the percentage of infection upon that property. From the time that hunting operations began in 1912 until June 7, 1912, squirrels were found as follows:

County.	Squirrels found.	Squirrels infected.	Percentage of infection.
Contra Costa.....	9,477	110	<i>Per cent.</i> 1.16
Alameda.....	1,516	56	3.7

From the time that hunting operations began in 1913 until June 7, 1913 (this period being slightly longer in 1913 than in 1912), squirrels were shot as follows:

County.	Number of squirrels.	Squirrels infected.	Percentage of infection.
Contra Costa.....	6,926	70	<i>Per cent.</i> 1.01
Alameda.....	217		

The total squirrels for the two counties in 1912 was 10,993; infected 166; percentage of infection 1.5 per cent.

The total squirrels for the two counties in 1913 is 7,143; number infected, 70; percentage of infection, 0.98 per cent.

The percentage of infection, therefore, for the year 1913 is 65 per cent of that of 1912, so that there has been an apparent reduction of infection, under conditions as nearly identical as possible, of 35 per cent.

This statement is submitted in view of the relatively large number of infected squirrels that are now being reported and that probably will be reported in the future, in order that a thorough understanding of the situation may be had.
